CLGU Custom Coupling Guard

Recommendations:

CLGU guard is recommended for use when guarding a direct drive shaft and coupling when a stock ANSI barrel guard is not applicable. This guard allows the user to drill and mount the guard to the equipment foundation once the bow-tie hold-down brackets have been removed (used to secure guard during shipping).

- Pros:**
- 2-piece guard design allows easier installation when additional clearance on each side of coupling is limited due to obstruction when replacing current non-compliant OSHA guards.
 - Slotted cover is optional for heat dissipation
 - Standard guard includes a top inspection window that is easily removed with a tool.
 - Side inspection windows are an option when guards are large or mounted in elevated locations when a ladder would be needed for inspection.
 - Allows easier maintenance to coupling as it allows removal of either half of the guard to gain access.

Cons:

- Additional fasteners are used due top inspection window and angle brackets securing both halves of the guard together.
