Mounted Belt/Chain Guard

Recommendations:

Uniguard Mounted Belt Guards can be created with many custom options. Standard guards are designed as a center split but we can incorporate a flanged back when there are space limitations below the sheaves.

Options:

- Inspection windows can be placed on width panels to allow maintenance to check belt tension or on front panels for checking RPM.
- Lifting handles for assistance with guard removal.
- Removable front panel for belt/chain maintenance.
- Slotted cover is optional for heat dissipation
- Back panels can be solid or split flanged.
- Oil bath liner for chain with level gauges and drain ports.

Descriptions:

- Center split designs are normally mounted using brackets attached to the equipment and attached to angle brackets on each end and allows the top and bottom of the guard to come together when over/under space is not a consideration.
- Flanged back option can be either a solid or split. A flanged back allows the end user to install the 9/16" HDPE back panel to the equipment and then securing the rest of the guard to this attached back panel eliminating the need of securing the guard to the foundation.
- Split flanged back allows installation without sheave removal whereas the solid flanged back requires sheave removal.
